Skyline Routine User Guide

A desktop flight reminder that turns a schedule into a flight taking off on time.

For the latest release · Data stays on this computer

1. What This Tool Is For

Skyline Routine is a desktop flight reminder.

Instead of showing a notification that disappears after a few seconds, it sends a plane across your screen when a reminder is due. The plane keeps cruising until you click the plane or the reminder text to acknowledge it. If you do not click, it lands automatically after the maximum flight time.

It is useful for small but important things that are easy to ignore:

- Drinking water, standing up, or taking a screen break
- Taking medicine, meetings, appointments, or leaving work on time
- Pomodoro sessions, stretching, meditation, or eye rest
- Any recurring routine that should be **seen and acknowledged**

In one sentence: **turn a schedule into a flight that takes off on time, so the reminder actually gets your attention.**

Reminder data stays on your computer. There is no account and no cloud sync.

2. Quick Start

1. Install and open Skyline Routine.
2. Click **New reminder**.
3. Enter the reminder text, then choose a departure time and repeat mode.
4. Click **Save route**.
5. Keep the app running. When the time comes, a plane appears on screen.
6. Click the plane or the reminder text to end it. If you do nothing, it lands automatically after the maximum flight time.

Closing the settings window does not quit the app. Skyline Routine stays in the system tray and keeps triggering reminders.

3. Two Editions

The project offers a full edition and a light edition. Their features and workflow are essentially the same.

	Full edition	Light edition
Technology	Electron	Tauri
macOS	Apple silicon / Intel	Apple silicon / Intel
Windows	Installer / portable	Requires WebView2; usually built by project CI
Size	Larger	Very small
Best for	A ready-to-use, consistent cross-platform app	A smaller footprint, especially on macOS

Both editions share the same reminder data. **Do not run both editions at the same time**, or the same reminder may fire twice. Quit one edition before switching to the other; your data is preserved.

The Mac App Store listing uses the full Electron edition. The Tauri light edition is intended for local or direct distribution.

Free and Pro

The Mac App Store edition is **free to download with a one-time Pro in-app purchase**. There is no subscription:

	Free	Pro
Active reminders	Up to 3	Unlimited
Built-in aircraft	4 basic styles	All 12 styles
Custom aircraft image	Not included	Included
Theme styles	Default Skyline	Skyline + Aurora / Sunset / Midnight / 1024
Languages / auto-land	Included	Included

- Click **Upgrade to Pro** at the top right to see the App Store price and purchase.

- Pro unlocks immediately after purchase; use **Restore purchases** on another Mac.
- Selecting a locked aircraft, a Pro theme, or a custom image also opens the upgrade panel.
- Pro is a one-time purchase, not a subscription. Apple handles payment; reminder data stays on your computer.

4. Installation

macOS

Requires macOS 13 or later.

1. Open the downloaded DMG.
2. Drag Skyline Routine or Skyline Routine Light into **Applications**.
3. Launch it from **Applications**.

If macOS says you are running a disk-image copy, quit the app completely and open the copy in **Applications**. Running directly from the DMG also disables features such as launch at login.

The app is not currently notarized by Apple. If macOS blocks the first launch, allow it in **System Settings → Privacy & Security**.

Windows

- **Installer**: run `Skyline Routine Setup x.x.x.exe` and follow the prompts.
- **Portable**: run `Skyline Routine x.x.x.exe` directly; no installation is required.
- **Light edition**: requires the system WebView2 runtime. Windows 10/11 usually includes it; install the WebView2 Runtime if the app cannot start. The Windows light edition is usually produced by the project's GitHub Actions workflow. Most Windows users should use the full edition installer.

5. Creating a Reminder

From the main window, click **New reminder** and fill in the following:

Reminder text

Up to 100 characters, for example "Drink water", "Stand up for two minutes", or "Meeting prep". Long text wraps automatically and is shown in full on the flight overlay.

Departure time and repeat mode

Repeat mode	Behavior	What to set
Daily	Remind at the same time every day	Departure time
Weekdays	Remind Monday through Friday	Departure time
Once	Remind only once on a chosen date	Date + departure time
Interval	Repeat within a time range	Repeat days, interval, start/end time

For **Once**, the date and time must be in the future.

For **Interval**, also set:

- **Repeat on**: daily, weekdays, or once.
- **Remind every**: for example, every 30 minutes or every 2 hours.
- **Start time / End time**: only remind inside this window, for example 09:00–18:00.

The interval cannot be longer than the time window. For example, a 09:00–18:00 window allows an interval of up to 9 hours. The editor shows the current maximum.

Aircraft

Each reminder can use its own aircraft:

- Built-in aircraft: Fighter, Stealth fighter, Airliner, Transport, Propeller, Biplane, Airship, Flying carriage, Glider, Seaplane, Helicopter, Paper plane.
- Custom image: PNG, JPG, or WebP; transparent PNG backgrounds look best.
- **Use default**: use the default aircraft from Settings.

Flight height

Choose **Use default**, **High**, **Mid**, or **Low**. This affects only the current reminder.

Custom flight paths

Open **Settings → Flight paths** to create one or more routes:

1. Click **New path**.
2. Enter a name.
3. Press and drag on the canvas, which uses the current screen aspect ratio, to draw the route.
4. Click **Save path**.

When creating or editing a reminder, choose under **Flight path**:

- **Follow flight height**: uses the High / Mid / Low setting above.
- **A saved custom path**: the plane follows that route and ignores flight height.

You can save and reuse multiple paths. Routes are smoothed automatically; an open route enters from outside the screen, leaves along the end direction, waits until both the plane and text card are fully off-screen, turns around outside, and flies back from the endpoint side. The same turn happens at the start side. The text card stays behind the plane and at a readable angle.

Reminder card style

Choose **Follow settings**, or pick a style just for this reminder:

- Skyline glass: translucent dark glass card; the default style.
- Deep solid: opaque dark card with stronger contrast.
- Flight outline: transparent background with a glowing outline.
- Boarding pass: light paper card with dark text.
- Neon night: dark card with cyan and pink neon light.
- Minimal text: no card background, just the text.

With **Follow settings**, the reminder uses the default from **Settings → Appearance & language → Reminder card style**; later changes to that default apply automatically.

Save

Click **Save route**. New reminders appear at the top of the route list.

To choose the repeat mode used by future reminders, open **Settings → New reminder default**. That setting only affects new reminders and does not change existing ones.

6. When a Reminder Fires

When the time arrives, the plane appears above other windows and keeps cruising.

- **Click the plane or the reminder text**: the flight lands immediately.
- **Do nothing**: the plane lands automatically after the maximum flight time.
- **Click empty areas**: you can keep working in other windows; the overlay does not block the whole screen.
- **Several reminders at the same time**: flights take off one after another and do not overlap.
- **Flight preview**: use **Preview a flight** in Settings to see the effect in advance.

The overlay requires the app to be running. If you quit the app, reminders will not fire.

7. Managing Reminders

The route list on the main window lets you:

- Enable or pause a reminder
- Preview that reminder's flight
- Edit its text and settings
- Delete it
- Drag to reorder reminders

Paused reminders stay in the list but will not take off. The "Next" area at the top of the main window shows the nearest upcoming reminder.

8. Settings

Click **Settings** at the bottom right of the main window, or open Settings from the system tray menu.

Appearance & language

- **Appearance**: Light, Dark, or follow the system.
- **Language**: follow the system, or choose Simplified Chinese, Traditional Chinese, English, Japanese, Korean, Spanish, French, or German.
- **Theme style**: Skyline is free; Aurora, Sunset, Midnight, and 1024 are Pro themes.
- **Reminder card style**: sets the default card style for new reminders: Skyline glass, Deep solid, Flight outline, Boarding pass, Neon night, or Minimal text.
- **Flight paths**: manage, create, edit, and delete custom flight routes.

Settings are saved automatically.

Runtime

- **Launch at login**: wait in the tray after you log in. On macOS, the app must be in **Applications**; this option is unavailable when running from the DMG.
- **Takeoff animation**: when enabled, the plane takes off and climbs into view; when disabled, it starts cruising directly.
- **Preview a flight**: show a sample flight immediately.

- **Max flight time**: default 5 minutes. Choose 5, 15, 30, or 60 minutes, or select **Custom** and enter 1–60 minutes.

How max flight time works:

Reminder type	Actual flight duration
Daily / Weekdays / Once	The configured maximum flight time
Interval	The smaller of the configured maximum and the reminder interval
Manual click	Lands immediately, regardless of the maximum
Flight preview	Follows the maximum flight time

Examples:

- Max flight time is 5 minutes: a normal reminder lands after 5 minutes.
- Interval is 10 minutes and max flight time is 60 minutes: the flight lasts at most 10 minutes so it does not overlap the next one.
- Interval is 1 hour and max flight time is 5 minutes: the flight lands after 5 minutes.

New reminder default

Sets the repeat mode preselected when creating a reminder. The default is **Weekdays**.

Default aircraft, height, and card

Sets the aircraft, flight height, and reminder card style used when creating a new reminder. Individual reminders can override these defaults.

Feedback

The **Feedback** item in the settings sidebar offers three options:

- Report a bug
- Suggest a feature
- General feedback

It opens your default email app with `runningswiftui@gmail.com`, including the app version and platform. The email subject and body follow the current app language.

9. System Tray

Closing the main window closes the interface, but the app process and tray icon remain.

Exit at the bottom of the settings sidebar hides the main window to the tray; **Settings** in the tray menu opens it again.

The tray menu typically contains:

- **Settings**: reopen the main window.
- **Preview flight**: show a flight preview immediately.
- **Quit**: exit the app completely; reminders will stop.

On macOS, the tray icon is in the menu bar. On Windows, it is usually in the notification area at the bottom right of the taskbar.

Only Quit in the tray menu ends the app. Closing the window, using Exit in the sidebar, or pressing Cmd+Q does not stop reminder scheduling.

10. Data, Backup, and Upgrades

Both editions use the same data file:

- macOS: `~/Library/Application Support/skyline-routine/skyline-routine.json`
- Windows: `%APPDATA%\skyline-routine\skyline-routine.json`

The app keeps a `.bak` backup automatically. Reminders and settings are stored in this JSON file and are never uploaded to the internet.

Upgrading the app or switching between the full and light editions does not delete your data. The project does not currently include automatic updates, so download and install a new version when needed; your existing reminders will continue to work.

Before manually editing or cleaning up the data, quit the app and make a copy of the JSON file.

To remove all data: quit the app, then delete the JSON file and its `.bak` file. Uninstalling the app alone may not remove this data.

11. FAQ

No plane appeared at the scheduled time?

Check the following:

1. Is the app still running? Did you choose **Quit** from the tray menu?
2. Is the reminder paused?
3. For a **Once** reminder, has the date already passed?
4. For an **Interval** reminder, are you currently inside its start–end window?
5. Is the computer asleep or powered off? Reminders cannot appear while the computer is asleep.

Why didn't the reminder stay on screen forever?

A reminder cruises until you click it, but it lands automatically after the **Max flight time**. You can change that duration in Settings.

Why did an interval reminder land early?

For interval reminders, the actual flight duration is the smaller of the max flight time and the reminder interval. This prevents one flight from overlapping the next.

Can I run the full and light editions at the same time?

It is not recommended. They share the same data, so running both may fire the same reminder twice. Keep only one edition running.

The installer says the app is unsigned or cannot be verified.

The current builds are not formally code-signed or notarized. On macOS, allow the app in **Privacy & Security**. On Windows, choose **More info → Run anyway** in the SmartScreen prompt. Only download installers from the project's Releases page.

My custom aircraft image does not appear.

Use PNG, JPG, or WebP. A transparent PNG usually looks best. Very large or unsupported files may fail to load; try another image.

Will I lose my reminders after switching editions?

No. Both editions use the same local data. Quit the running edition first, then open the other one.

Does the reminder make a sound?

The current experience is primarily visual: a plane and reminder text on screen. Keep the app running and watch your screen.

12. Suggested Uses

- Water, eye rest, and stretching: use **Interval** during your working hours, for example every 45 minutes.
- Medicine: use **Daily** or **Weekdays** at a fixed time.
- A one-off meeting or appointment: use **Once** and choose the date and time.
- Make reminders more noticeable: use a high flight height, a larger aircraft, a custom image, or the Neon night / Deep solid card style.
- Avoid choosing a repeat mode every time: set **New reminder default** in Settings.
- Have the app ready after login: put it in **Applications**, enable **Launch at login**, then close the window and let it run in the tray.
